AIG-INV-05 | CAPABILITIES + SYSTEM MAP

Status	Draft for Council review. AIG-INV-05 is the controlled-artefact ID assigned in this proposed suite. This remains an empty draft, not approved, effective or operational. Proposed control designation does not itself confer adoption or approval.
Version	v0.3 proposed design draft (see Document Control); formal version control begins only if adopted.
Owner / custodian	To be confirmed by the competent authority; proposed day-to-day custodianship is shared between the Governance function and authorised service/architecture data owners.
Approving authority	Not yet confirmed. Competent delegated Council authority and publication route must be verified; Governance Lead custody or assurance oversight is not approval.
Approval / effective date	Not approved; no effective date.
Access and retention	Proposed controlled access, confidentiality classification, retention period and disposal route remain to be confirmed before any real system or component records are entered.
Change control	Proposed changes require a dated change record, reason, owner validation, version update and delegated approval where the schema or control rules change. Design changes are recorded on the Document Control sheet; no live data change history is included.
Question it answers	Which outcome-led use cases need which atomic capabilities; which governed AI systems provide them; and which model, data, interface, agent and tool references those systems depend on.
Workflow route	1. Discover and complete Intake (AIG-INV-03). 2. Governance issues/reconciles the stable AIR-ID in the Register (AIG-INV-04). 3. Complete risk triage and triggered assessments. 4. Record gate plans/events/conditions in AIG-DEC-04; the delegated Council forum decides and records its decision in AIG-DEC-03 or approved minutes. 5. Operate under AIG-OPS-01 and monitor through AIG-OPS-02.
ID rule	AIG-… IDs label suite documents; AIR-ID identifies one governed system and remains stable when documents change. AIG-INV-05 is the controlled-artefact slot in this proposed edition, but its map is descriptive only—not an approval, access grant or decision source.
Read in order	For map work, start with Use cases and Capabilities; enter only AIR-IDs reconciled to AIG-INV-04; record sourced component pointers in Components; link them in Relationships; review the derived System map; track uncertainty in Gaps and actions and changes in Map changes; use Dependency concentration for the whole-portfolio view of shared components and suppliers.
No second Register	AIG-INV-04 remains the authoritative record of AIR-ID, purpose, Service Owner and current status. System map includes only a manually reconciled label/pointer and confirmed relationship counts, not another approval status.
No inferred authority	AIG-DEC-04 contains plans, actual gate events and conditions; AIG-DEC-01 routes governance forums. AIG-AGT-04 is authoritative for agent scope and tool permissions, AIG-AGT-05 for derived delegation paths. A map link grants no access, approval or decision right.
Reference rules	AIG-INV-03 describes use cases; AIG-ASS-09 documents models where applicable; AIG-AGT-04 and AIG-AGT-05 cover agent and authority specifics; other assessments, AIG-DEC-03 decisions and AIG-OPS-02 monitoring stay in their own records. Cite source version/row rather than copying controls.
Evidence standard	A Confirmed relationship requires a named owner, source reference, High/Medium confidence and verification date, plus confirmed, source-reconciled endpoints. The QA checks are structural prompts only; source facts and applicability require human verification.
Zero is not absence	A zero on System map means no confirmed, QA-clean link has been recorded. It does NOT prove that a capability, agent, model, data asset, interface or tool is absent. Record N/A with rationale in review notes.
Access changes	A new or expanded system/tool access edge requires owner review and reassessment; record the change and link AIG-AGT-04/AIG-AGT-05/AIG-AGT-03, AIG-INV-04/AIG-DEC-04 or specialist evidence as appropriate. A spreadsheet cannot detect an unreported production edit.
Before adoption	Agree node/edge granularity, source catalogue reuse, ID allocation and ownership; trial contrasting real cases, reconcile official AIG-INV-04/AIG-AGT-04 sources, test in Excel, and confirm document control, access, retention, approval and migration arrangements.
Dependency concentration	Proposed — for Council confirmation. Whole-portfolio view (Playbook §4.5.8; AIG-AIMS-10 M-16): distinct AIR-IDs relying on each component (confirmed, QA-clean links only) and on each supplier from the controlled AIG-INV-04 extract, with share and a flag against a threshold the Council sets (blank = no flag). Zero is not absence; AIG-INV-04 does not change.

SYSTEM MAP / CONFIRMED COVERAGE

Enter only official AIR-IDs issued through AIG-INV-04. Labels are a dated snapshot; counts use confirmed, QA-clean links only. Zero means not mapped or unconfirmed, not absent.

AIR-ID (from AIG-INV-04)	System label (AIG-INV-04 snapshot)	AIG-INV-04 source / version	AIG-INV-04 reconciled on	Capabilities	Models	Data assets	Interfaces	Agents	Tools	Proposed links	Links needing review	Review state	Review notes / N-A rationale	Row check

OUTCOME-LED USE CASES

Use AIG-INV-03 as intake source; keep one distinct outcome/workflow per stable UC-ID linked to one system AIR-ID when issued. Decision and monitoring fields are source pointers only; this map never grants approval.

UC-ID	Outcome-led use case	Service / workflow	Service Owner	Canonical AIG-INV-03 / source ref	AIR-ID (only if issued)	Confidence	Verified on	State	Row check	decision / minutes ref	specific monitoring ref (pointer	role (descriptive; not

ATOMIC REUSABLE CAPABILITIES

Describe a function as a verb + noun, not as a vendor product, AI agent permission or project title. Reuse an existing canonical capability catalogue if agreed.

CAP-ID	Function (verb + noun)	Inputs	Outputs	Boundary / excluded use	Capability owner	Definition source ref	Confidence	Verified on	State	Row check

COMPONENT REFERENCES / NOT CONTROL COPIES

One version-specific pointer per model, data asset, interface, agent or tool. AIG-ASS-09/AIG-AGT-04/AIG-AGT-05, catalogue and specialist sources remain authoritative; no permission is granted here.

Reference ID	Type	Name / short label	Version / config	Canonical source artefact	Exact source row / URI	Owning AIR-ID (if any)	Source owner	Confidence	Verified on	State	Row check

EVIDENCED RELATIONSHIPS / EDGES

UC → CAP may be staged without AIR-ID. Other edges need official AIR context. Confirmed links require owner, source, confidence and verification date; links do not confer permissions. Superseded rows are kept as history and excluded from duplicate tests; an AIR → component edge must match the component's owning AIR-ID.

Map Edge ID	From type	From ID	Relationship	To type	To ID	AIR context	Meaning / data or action flow	Link owner	Evidence / source ref	Confidence	Verified on	State	Link check

DEPENDENCY CONCENTRATION / PORTFOLIO VIEW (Proposed — for Council confirmation)

Whole-portfolio view of shared dependencies. Counts distinct AIR-IDs relying on each model, data asset, interface, agent or tool (confirmed, QA-clean links only) and on each supplier or source. Derived view only: it does not change the AI Register (AIG-INV-04), grant approval or set the threshold, which the Council sets.

Threshold and portfolio summary		
Threshold for concern (set by the Council)		Blank by default. Enter a share (for example 25%) only once the Council sets it; while blank, no flag is shown.
Mapped AIR-IDs on System map (distinct)		Denominator for component shares. Blank until AIR-IDs are entered on System map.
Largest component share		
AIR-IDs in supplier extract (distinct)		Denominator for supplier shares. Blank until the AIG-INV-04 extract is pasted.
Largest supplier share		
Largest share overall (AIG-AIMS-10 M-16)		
Dependencies flagged for review		Blank while no threshold is set. Name the High/Critical UC-IDs relying on each flagged dependency in the AI Assurance Board Report (AIG-OPS-05).

Notes (Proposed — for Council confirmation)
Purpose: supports the Playbook portfolio view of AI risk (§4.5.8) and measure M-16 in AIG-AIMS-10 (dependency concentration); the result is reported through AIG-OPS-06 and the AI Assurance Board Report (AIG-OPS-05).
Zero is not absence: a zero or blank count means no confirmed, QA-clean link or extract row has been recorded. It does NOT prove that no AIR-ID relies on the model, data asset, interface, tool or supplier.
Source of truth: AIG-INV-04 is authoritative for AIR-ID identity and supplier; AIG-INV-05 Components and Relationships hold the links. This sheet is derived: it does not change the Register and grants no access, approval or decision.
Component method: counts Relationships rows with From type AIR, Relationship "references", To ID = the component, State Confirmed and Link check OK (the same confirmed-state test as System map). A duplicated live link fails the link check and is excluded from the count until it is resolved (zero is not absence); once resolved, each AIR-ID counts once per component. A shared component must leave "Owning AIR-ID" blank on Components, or other AIR-IDs' links fail the check.
Supplier method: paste AIR-ID and supplier / source from the controlled AIG-INV-04 extract, then type each supplier name once in the summary (same spelling as the extract). Each AIR-ID counts once per supplier (duplicate rows are ignored).
Flag: "Review: concentration" shows when a share is at or above the Council's threshold and at least one AIR-ID relies on the dependency. The High/Critical UC-IDs relying on a flagged dependency are named in the AI Assurance Board Report.
Before use: confirm the threshold, supplier naming and the extract date; record the as-at dates of the Components, Relationships and AIG-INV-04 extract used for each report.

Table 1: Components (derived from Components and Relationships)

Reference ID (from Components)	Type	Name / short label	AIR-IDs relying on it	Share of mapped AIR-IDs	Concentration flag

Table 2a: Supplier extract (paste from the controlled AIG-INV-04 extract)

AIR-ID	Supplier / source (from the controlled AIG-INV-04 extract)	Row check

Table 2b: Suppliers (type each supplier once)

Supplier / source	AIR-IDs relying on it	Share of AIR-IDs in extract	Concentration flag

UNKNOWN / ACTION LOG

Do not invent links to fill a map. Record missing sources, conflicting IDs, unresolved applicability and who will answer.

Action ID	Node / AIR-ID	Gap / N-A question	Impact on map	Action owner	Due date	State	Evidence / resolution ref	Resolved on	Notes

MAP CHANGE LOG / REASSESSMENT

Log changed relationships and access. 'Expand access' and 'Add link' always count as access expansion and need a reassessment ref, whatever column H says; 'Reduce access' and 'Remove link' can close without one. A map update is not permission or a gate decision.

Map Change ID	AIR-ID	Map Edge ID	Change date	Change type	Previous link / access	New link / access	Access expansion?	Change owner	Review / reassessment ref	Gate Event ID (if needed)	State	Change check

ID / link	Authoritative source	Meaning and boundary	Before adoption
AIR-ID	AIG-INV-04 AI Register	Governance-issued permanent system ID. Enter existing ID in System map; never invent/recycle it.	Confirm allocation and reconciliation process
UC-ID	This map; AIG-INV-03 as factual source	One outcome/workflow; can exist provisionally before AIR-ID. Link UC → CAP with source.	Approve ID scheme and granularity
CAP-ID	This map or approved capability catalogue	Reusable verb+noun function, inputs/outputs and boundary; not an agent permission.	Choose canonical capability catalogue
MOD / DATA / IF reference	AIG-ASS-09 / existing data or interface catalogue and specialist source	Version-specific pointers; detailed model, data or security controls stay in source.	Confirm canonical source and versioning
AG / TOOL reference	AIG-AGT-04 Agent Record and exact agent/tool row; AIG-AGT-05 for authority	Stable reference and versioned source pointer. Map edge is not delegation or permission.	Confirm stable AG-ID and tool ID policy
Map Edge ID	This map	Unique relationship with type, source, owner, confidence, verification and state. Named 'Map Edge ID' to distinguish it from the Authority Edge ID in AIG-AGT-04.	Agree ownership, lifecycle and review frequency
UC → CAP	requires	Early discovery link; AIR context may be blank. A proposed link is not confirmed deployment.	Approve semantics
CAP → AIR	provided by	Only official AIR-ID; one capability can be provided by several systems and vice versa.	Approve semantics
AIR → MOD/DATA/IF/AG/TOOL	references	AIR context required; refer to exact canonical component, not duplicate controls.	Review material access changes
AIR → AIR	depends on	Record material system dependency with source. Self-dependency and two-node cycles (A depends on B and B on A) are flagged.	Agree treatment of cycles / shared services
Map Change ID	Map changes	Independent change trail (distinct from the AIG-INV-04 Register Change ID). Access expansion requires reassessment evidence and AIG-DEC-04 event where needed.	Agree trigger / escalation owner
Dependency concentration	Derived from Components and Relationships (this map); supplier from the controlled AIG-INV-04 extract	Proposed — for Council confirmation. Portfolio view only: counts distinct AIR-IDs per component and per supplier and flags shares at or above the Council's threshold. Grants no approval, sets no appetite and does not change AIG-INV-04.	Council sets the threshold for concern; agree supplier naming and extract cut-off

AIG-INV-05 — Document Control

Controlled working template. Draft for Council review; not Council-adopted and not effective until formally approved.

Field	Controlled value
Document ID	AIG-INV-05
Artefact	Capabilities and System Map (proposed)
Version	0.3 proposed design draft
Status	Draft for Council review
Document owner	To be confirmed by the competent authority (proposed custodian: AI Governance Lead with authorised service/architecture data ov
Approving body	Not yet confirmed. Competent delegated Council authority to be verified; AI Assurance Board provides assurance where applicable
Approval date	Not yet approved
Effective date	Not yet effective
Next review date	To be set on approval: 12 months after effective date or sooner following material change
Classification	OFFICIAL

Change history

Version	Date	Change	Author / owner
0.1 proposed design draft	Not recorded in source	Initial proposed design (START HERE ‘v0.1’).	Not recorded in source
0.2 proposed design draft	29 September 2026	QA remediation — applied findings QA-234, QA-251, QA-269, QA-270, QA-271, QA-291, QA-293 (see QA change log).	AI Governance Lead
0.3 proposed design draft	30 September 2026	v3.9: added the Dependency concentration sheet (Proposed — for Council confirmation): components and suppliers relied on by mapped AIR-IDs, share of mapped AIR-IDs, Council-set threshold flag (blank by default) and notes; feeds AIG-AIMS-10 M-16. START HERE and ID and source rules updated. Follow-up: component method note clarifies that a duplicated link fails	AI Governance Lead
